Education

Bachelor of Science, Computational and Data Sciences December 2024
George Mason University - Fairfax, VA
Associate of Science, Computer Science June 2021
Northern Virginia Community College - Alexandria, VA

Skills & Certifications

Technologies: Excel, Tableau, Power BI, Microsoft Word, Microsoft PowerPoint
Languages: SQL, Python
Skills: Business and Data Analysis, Requirements Gathering, KPI Definition, Performance Metrics, Data Collection, Dashboard Development, Agile/Scrum, Cross-Functional Collaboration, Written & Verbal Communication, Secure Data Handling, Detail-Oriented
Certification: AWS Certified Cloud Practitioner
Security Clearance: Secret

Work Experience

Operations Coordinator **Washington D.C.**
Always Towing and Recovery March 2025 – Present
- Performed trend analysis and operational performance monitoring using transactional and operational data, contributing to an 18% reduction in average response time.
- Translated operational and management requirements into data-driven process improvements, reducing scheduling conflicts and idle time by 10%
- Developed and maintained Excel-based tracking reports and KPI dashboards for response time, job completion, and downtime metrics, improving fleet utilization by 12%
- Collaborated with drivers, supervisors, and leadership to support process improvement initiatives and align operational metrics with business objectives.

Data Analyst **Fairfax, VA**
ICF International June 2024 – August 2024
- Leveraged Python, SQL, and Excel to clean, validate, and analyze large datasets, improving data accuracy by 7% and supporting data-driven decision-making across project teams
- Developed interactive Tableau dashboards and KPI reporting tools to visualize performance metrics, reducing manual reporting time by 9% and enhancing stakeholder visibility into project outcomes
- Conducted exploratory data analysis (EDA) and trend analysis on client datasets, delivering actionable insights that contributed to process improvements and increased reporting efficiency by 5%

Dispatcher **Washington D.C.**
Abe's Transportation August 2021 - May 2024
- Built Excel dashboards tracking route utilization, and on-time departure rates, presenting weekly KPI summaries to operations management.
- Analyzed historical dispatch logs and ridership data to identify demand patterns, reducing scheduling conflicts by 15%.
- Coordinated real-time data collection across multiple routes to monitor operational performance and support data-driven staffing decisions.

Projects

Workforce Operations & KPI Analysis — George Mason University (GitHub) January 2024 – April 2024
Tech: SQL, Excel
- Designed a 4-table relational schema (employees, attendance, overtime, performance reviews) and populated it with 3 months of operational records across 5 departments and 15 employees.
- Authored 20+ SQL queries extracting KPIs including payroll estimates, attendance rate flags, Q1 vs Q2 performance score deltas, and overtime cost by department, surfacing an 18% attendance variance across regions.
- Built a 6-tab Excel dashboard with conditional formatting, pivot tables, and embedded charts, flagging employees below 80% attendance and identifying Logistics as the highest overtime cost department .

Customer Churn & Revenue Risk Analysis — Personal Project (GitHub) October 2023 – December 2023
Tech: SQL, Excel, Python, Tableau
- Designed a 4-table schema and authored 15+ SQL queries to calculate churn rates by segment, build a composite health score weighted across usage, satisfaction, and tenure, and classify every account as CRITICAL, HIGH, MEDIUM, or LOW risk.
- Trained a logistic regression model in Python using 7 behavioral features extracted from SQL, including usage score drop and billing ticket frequency, achieving clean separation between churned accounts and active accounts.
- Developed a 4-sheet Tableau dashboard with a revenue heatmap, customer health scatter plot sized by MRR, and a usage trend comparison — revealing that churned customers averaged a 6x lower usage score than active customers in the months before churn.
- Built an Excel executive summary with a live what-if scenario model showing that reducing churn from 40% to 25% recovers $93,410 in annual revenue, giving leadership a quantified business case for customer retention investment.
